Finding Proofs for Description Logic Entailments in Practice

Based on "Finding Small Proofs for Description Logic Entailments—Theory and Practice" (LPAR'20) // Explainable Logic-Based Knowledge Representation (XLoKR 2020), September 14, 2020

Description Logics and Ontologies

Syntax of DL \mathcal{ALC}

Concepts: $C ::= A \mid \neg C \mid C \sqcap C \mid C \sqcup C \mid \exists r.C \mid \forall r.C$ Axioms: $\alpha ::= C \sqsubseteq C \mid C \equiv C$

Description Logics

- Well-established formalism for specifying terminological knowledge in Ontologies
- Used for many large-scale ontologies
 - SNOMED CT: over 300,000 concepts
 - BioPortal: repository of bio-medical ontologies, currently hosting 889 ontologies defining 12,084,317 terms
 - MOWLCorp: ontologies obtained by web-crawling, containing 21,000 ontologies

Description Logics and Ontologies

Syntax of DL ALCConcepts: $C ::= A | \neg C | C \sqcap C | C \sqcup C | \exists r.C | \forall r.C$ Axioms: $\alpha ::= C \sqsubseteq C | C \equiv C$

Description Logics

- Well-established formalism for specifying terminological knowledge in Ontologies
- Used for many large-scale ontologies
- With increasing complexity of the ontology, understanding entailments becomes both crucial and difficult

Description Logics and Ontologies

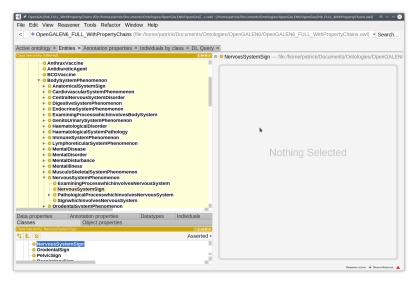

Syntax of DL ALCConcepts: $C ::= A | \neg C | C \sqcap C | C \sqcup C | \exists r.C | \forall r.C$ Axioms: $\alpha ::= C \sqsubseteq C | C \equiv C$

Description Logics

- Well-established formalism for specifying terminological knowledge in Ontologies
- Used for many large-scale ontologies
- With increasing complexity of the ontology, understanding entailments becomes both crucial and difficult
- One typical reasoning task is classification
 - compute all entailed axioms of form $A \sqsubseteq B$
 - obtain concept hierarchy

Slide 2 of 25

Justifications

Justifications: Minimal subsets entailing given subsumption

In practice often insufficient :

- can be large
- inferences often not obvious

Showing how to obtain the inference would be better

- simple reasoning steps leading to conclusion
- generally known as proof

C. Alrabbaa, F. Baader, R. Dachselt, T. Flemisch, P. Koopmann: *Visualizing Proofs and the Modular Structure for Ontology Repair*, DL 2020.

Proofs with ELK

■ ELK using a *consequence-based* reasoning procedure
 ⇒ inferences performed using a calculus

 $\mathbf{R}_{0} \underbrace{C \sqsubseteq C} \qquad \mathbf{R}_{\top} \underbrace{C \sqsubseteq \top} \qquad \mathbf{R}_{\Box}^{-} \underbrace{C \sqsubseteq D \sqcap E}{C \sqsubseteq D \land C \sqsubseteq E}$ $\mathbf{R}_{\Box}^{+} \underbrace{C \sqsubseteq D \land C \sqsubseteq E}{C \sqsubseteq D \sqcap E} \qquad \mathbf{R}_{\exists} \underbrace{C \sqsubseteq \exists r.D \quad D \sqsubseteq E}{C \sqsubseteq \exists r.E}$ $\mathbf{R}_{\bot} \underbrace{C \sqsubseteq \exists r.D \quad D \sqsubseteq \bot}_{C \sqsubseteq \bot} \qquad \mathbf{R}_{\exists} \underbrace{C \sqsubseteq \exists r.E}_{C \sqsubseteq E} : D \sqsubseteq E \in \mathcal{O}$ $\mathbf{R}_{\circ} \underbrace{C_{0} \sqsubseteq \exists r_{1}.C_{1}, C_{1} \sqsubseteq \exists r_{2}.C_{2} \ldots C_{n-1} \sqsubseteq \exists r_{n}.C_{n}}_{C_{0} \sqsubseteq \exists r.C_{n}} : r_{1} \circ \ldots \circ r_{n} \sqsubseteq r \in \mathcal{O}$

 \Rightarrow proofs generated as part of reasoning process

Finding Proofs for Description Logic Entailments in Practice Technische Universität Dresden // Christian Alrabbaa, Stefan Borgwardt, Patrick Koopmann, Alisa Kovtunova Evolainable Logic-Based Knowledge Representation (KLOKK 2020), September 14, 2020

Proofs For More Expressive DLs

- Currently, ELK is the only DL reasoner supporting proof generation
- ELK supports only a limited fragment of OWL, OWL EL
- More expressive reasoner often use other reasoning procedures
 - for a long time prominent: tableau reasoning
 - less convenient for understanding entailments
- Existing consequence-based reasoning for expressive DLs
 - often involved in complex systems
 - often combined with other reasoning paradigms
 - may use normal forms requiring different syntax
 - \Rightarrow generation of proofs not obvious
- Can we generate proofs without a calculus?

Slide 7 of 25

Justification-Based Proofs (Matthew Horridge 2011)

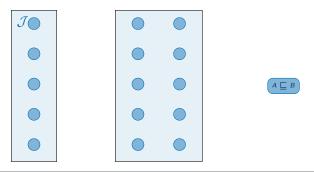

- derive intermediate steps between conclusion and justification
- consider all axioms of some predefined shapes
- justification-relation between allows to construct a proof
- involved ranking function allows to select axioms to be used in proof

Justification-Based Proofs (Matthew Horridge 2011)

- derive intermediate steps between conclusion and justification
- consider all axioms of some predefined shapes
- justification-relation between allows to construct a proof
- involved ranking function allows to select axioms to be used in proof

Advantage of approach:

generates best proof according to ranking

Disadvantage of approach:

- no clear inference principle
- hard to implement
- strongly depends on ranking function

Forgetting Based Proofs

- Idea from propositional resolution:
- \Rightarrow inference through elimination of *p*

$$\frac{q_1 \lor p \qquad q_2 \lor \neg p}{p_1 \lor p_2}$$

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \quad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of *p*
- Decide satisfiability by eliminating names one after the other:

$$b \quad a \lor b \quad \neg b \lor c \quad \neg b \lor \neg c \quad \neg a \lor c$$

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \quad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of *p*
- Decide satisfiability by eliminating names one after the other:

$$b \quad a \lor b \quad \neg b \lor c \quad \neg b \lor \neg c \quad \neg a \lor c$$

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \quad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of *p*
- Decide satisfiability by eliminating names one after the other:

$$b \quad \neg b \lor c \quad \neg b \lor \neg c \quad b \lor c$$

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \quad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of p
- Decide satisfiability by eliminating names one after the other:

$$b \quad \neg b \lor c \quad \neg b \lor \neg c \quad b \lor c$$

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \qquad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of p
- Decide satisfiability by eliminating names one after the other:

C ¬*C*

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \qquad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of p
- Decide satisfiability by eliminating names one after the other:

c ¬*c*

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \qquad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of *p*
- Decide satisfiability by eliminating names one after the other:

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \qquad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of *p*
- Decide satisfiability by eliminating names one after the other:

Idea: Use similar approach to prove axioms of form $A \sqsubseteq B$

Forgetting Based Proofs

Idea from propositional resolution:

$$\frac{q_1 \lor p \qquad q_2 \lor \neg p}{p_1 \lor p_2}$$

- \Rightarrow inference through elimination of *p*
- Decide satisfiability by eliminating names one after the other:

\bot

• Idea: Use similar approach to prove axioms of form $A \sqsubseteq B$

$$A \sqsubseteq C \qquad C \sqsubseteq \exists r.D \qquad \exists r.\top \sqsubseteq B$$

Forgetting

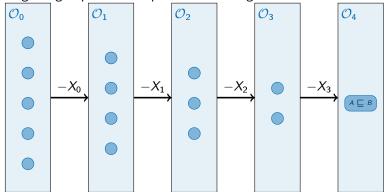

Definition

Let \mathcal{O} be an ontology and X a predicate name. Then, \mathcal{O}^{-X} is a *result of forgetting* X iff

- X does not occur in \mathcal{O}^{-X}
- for every axiom α in which X does not occur, $\mathcal{O} \models \alpha$ iff $\mathcal{O}^{-X} \models \alpha$
- \Rightarrow strongest ontology without X entailed by $\mathcal O$
- $\$ which α to preserve also depends on underlying DL

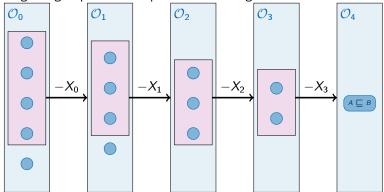

Use forgetting to produce sequence of ontologies

Slide 11 of 25

Use forgetting to produce sequence of ontologies

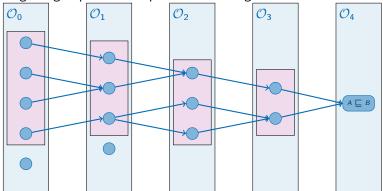

• In each step, recompute justification for $A \sqsubseteq B$

Slide 11 of 25

Use forgetting to produce sequence of ontologies

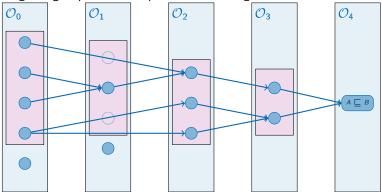

- In each step, recompute justification for $A \sqsubseteq B$
- Finally, reconstruct proof using justifications

Slide 11 of 25

Use forgetting to produce sequence of ontologies

- In each step, recompute justification for $A \sqsubseteq B$
- Finally, reconstruct proof using justifications, skipping steps if it makes sense

$$(C) \frac{A \sqsubseteq C}{(r)} \frac{(D) \underbrace{C \sqsubseteq \exists r.D}_{C \sqsubseteq \exists r.\top}}{A \sqsubseteq \exists r.\top} \exists r.\top \sqsubseteq B}{A \sqsubseteq B}$$

Slide 12 of 25

Forgetting Order

Forgetting order, as well as selection of justification, affects proof

Forgetting D first:

$$(C) \frac{A \sqsubseteq C}{(r)} \frac{(D) \underbrace{C \sqsubseteq \exists r.D}_{C \sqsubseteq \exists r.\top}}{A \sqsubseteq \exists r.\top} \qquad \exists r.\top \sqsubseteq B}{A \sqsubseteq B}$$

Forgetting r first:

$$(C) \xrightarrow{A \sqsubseteq C} (r) \xrightarrow{C \sqsubseteq \exists r.D \quad \exists r.\top \sqsubseteq B} A \sqsubseteq B}$$

Slide 13 of 25

Forgetting Order

To obtain nicer proofs *practically*, we process names using the following heuristics:

- role with non-trivial fillers last:
 - otherwise may hide most of inference:

$$(r) \frac{A \sqsubseteq \exists r.B}{A \sqsubseteq \forall r.C \sqcup D} \xrightarrow{B \sqsubseteq \exists s.D} C \sqsubseteq \forall s. \neg D}{A \sqsubseteq D}$$

- unnested names first
 - delay complex inferences
- less frequent names first
 - delay expensive forgetting operations
 - (also used by existing forgetting procedures)

Slide 14 of 25

Evaluation

- Implemented approach in modular fashion
 - easy exchange of different forgetting procedures, provided they produce OWL ontologies
 - easy comparison with proofs generated by ELK
 - Dijkstra-based search to extract shortest proof
 - use 2 forgetting tools in the evaluation
 - \mathcal{ALCH} variant of LETHE 0.6
 - ALCOI variant of FAME 1.0¹

¹there is a much improved version FAME 2.0, but it often creates ontologies outside of the OWL-standard

Slide 15 of 25

Evaluation: Corpus

- Focus on proofs in *ELH*
 - to be able to compare with ELK
 - easier extraction of justification patterns (see below)
- Use ontologies from the OWL Reasoner Evaluation 2015, OWL EL Classification Track
 - well-balanced mix of ontologies from different repositories
- Extracted 1,573 justification patterns
 - all entailments of form $A \sqsubseteq B$ or $A \equiv B$
 - all justifications for these entailments
 - abstract away concept and role names
 - remove resulting duplicates

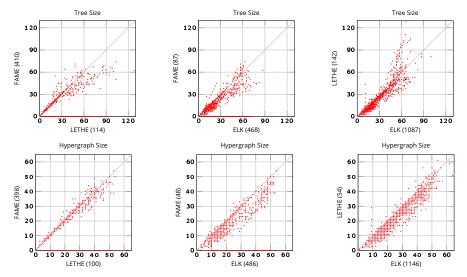

Evaluation: Metrics

- Hypergraph-size
 - number of distinct axioms used in the proof
- Tree-size
 - sub-proofs count as often as they are used
- Justification Complexity
 - Matthew et al. 2013: "Toward cognitive support for OWL justifications"
 - attempt to measure cognitive complexity of justification
 - provides value for each proof step
 - we measured maximum and sum for each proof

Evaluation: Justification Complexity

Finding Proofs for Description Logic Entailments in Practice Technische Universität Dresden // Christian Alrabbaa, Stefan Borgwardt, Patrick Koopmann, Alisa Kovtunova Explainable Logic-Based Knowledge Representation (XLOKR 2020), Spetember 14, 2020

Slide 23 of 25

Evaluation: Complexity of Inferences

- Both LETHE and FAME may use logical operators outside of \mathcal{EL}
- Large number of distinct "inference rules" was used:
 - LETHE: 362 different rules
 - FAME: 281 different rules

Conclusion

- New proof generation procedure based on forgetting
- Generate proof by repeated use of forgetting and justification
- Proofs for expressive DLs without calculus
- Can sometimes even compete with ELK
- Several possibilities to improve:
 - better heuristics on forgetting order or when to skip steps
 - dynamic selection of forgetting order
 - use learned "rules" to shorten proof computation times
 - integrate newer version of FAME
