

## Description Logics

### Exercise Sheet 11

Dr.-Ing. habil. Anni-Yasmin Turhan / Francesco Kriegel  
Winter Semester 2014/15

#### Exercise 42

Let  $f_1, \dots, f_m$  and  $g_1, \dots, g_n$  be (not necessarily distinct) abstract features. A *feature agreement* is a concept of the form  $(f_1 \circ \dots \circ f_m) \downarrow (g_1 \circ \dots \circ g_n)$  with the semantics:

$$((f_1 \circ \dots \circ f_m) \downarrow (g_1 \circ \dots \circ g_n))^{\mathcal{I}} := \{d \in \Delta^{\mathcal{I}} \mid f_m^{\mathcal{I}}(\dots f_2^{\mathcal{I}}(f_1^{\mathcal{I}}(d)) \dots) = g_n^{\mathcal{I}}(\dots g_2^{\mathcal{I}}(g_1^{\mathcal{I}}(d)) \dots)\}$$

*Feature disagreements* ( $\uparrow$ ) are defined analogously. The description logic  $\mathcal{ALCF}$  extends  $\mathcal{ALC}$  with feature agreements and feature disagreements.

Show that satisfiability w.r.t. general TBoxes is undecidable for  $\mathcal{ALCF}$ .

#### Exercise 43

Let  $\mathcal{D}$  be a concrete domain and  $\mathcal{ALC}(\mathcal{D})$  denote the extension of  $\mathcal{ALC}$  with the concrete domain  $\mathcal{D}$ . Show the following:

- If  $f$  is an abstract feature, then  $\exists f.C$  is equivalent to  $\exists f.T \sqcap \forall f.C$ .
- If  $\mathcal{D}$  contains only unary predicates, every  $\mathcal{ALC}(\mathcal{D})$  concept can be 'emulated' by a corresponding  $\mathcal{ALCN}$  concept.

#### Exercise 44

A *role complement* is a role of the form  $\neg r$ , where  $r$  is a role name. The semantics of role complements is defined as follows:

$$(\neg r)^{\mathcal{I}} := \Delta^{\mathcal{I}} \times \Delta^{\mathcal{I}} \setminus r^{\mathcal{I}}.$$

The description logic  $\mathcal{ALC}^{\neg}$  extends  $\mathcal{ALC}$  by role complements, i.e. role complements are allowed to occur in existential restrictions, value restrictions and role assertions.

Show that  $\mathcal{ALC}^{\neg}$  does not have the tree-model property.
